

ABSTRACT

A system and method for news-based trading are developed. According to one method, a trader can pre-define a trading strategy including a number of trading rules to be applied based on a comparison of one or more estimated event values to the respective actual event values to be released at some later time. The example method further includes, upon receiving one or more actual event values via a user input or directly from outside sources, executing one or more predefined trading rules selected based on the comparison of the received actual event values to the respective estimated indicator values.
